AVInaptic is a lightweight video processing software application that lets you view, scan, extract and remove audio/video clips from a video file, as well as perform some modifications to the files. Fuseki is a thin webserver that provides two web interfaces for browsing content and for uploading datasets. Both have a REST web API which makes it possible to perform queries directly from your own programs. Fuseki supports a broad range of storage formats, including the ones commonly used to store biological datasets: CSV, TXT, XML and JSON. It also supports the Purl format, but the field names of Purl files must be enclosed in double quotes in Fuseki's URLs. Fuseki does not enforce any specific URI scheme (e.g. http, https), and all paths can have any name. For each stored file, Fuseki returns a digest of the file content. A digest is an MD5 or SHA-256 hash which gives the same results for the same files. Fuseki supports header fetches where only the header of the file is requested and the content is only downloaded in the response body. This reduces the bandwidth requirements by about half and saves the server time. Fuseki lets you set up a collection to organize and structure your datasets. Collections serve the purpose of clustering datasets that share similar properties (e.g. metadata). A collection is a leaf element of a hierarchy of container elements, each of which is also a leaf element of a hierarchy of leaf elements (in this example: unique file names and folders): +-----+ |Fuseki:/// |
+----+-----+-----+ | | | | | | |
