The various drawing tools can be used in any combination to make documents for the real-world creation of anything from house plans to the most complex mechanical engineering designs. Use of the product by all industry groups is not difficult to find, due to its ease of use and extensive array of features, including functionality in 2D and 3D. It has been widely adopted into the manufacturing and architecture industries for engineering and technical drafting, particularly in the USA, Europe and Japan. In the same way, civil engineers use it for the design of bridges, tunnels and buildings. Schools use it to produce architectural and engineering drawings. The software is used for auto CAD/CAM operations. History The first version of AutoCAD was a DOS-based application that was available in an exe file format. The 2.0 version introduced the first 3D modeling program. The 3.0 version added a command language. In 1986, it was ported to Microsoft Windows, starting a new market. The 3.5 version shipped with the first Windows application programming interface (API) and introduced the "document" file type. The 6.0 version saw the introduction of the first of the Autodesk-based applications. What's New In?

The AutoCAD 2023 review on Autodesk website notes that markups "are not a feature of AutoCAD, but a feature of the applications that run inside AutoCAD." AutoCAD's chart of markups, which has been used since AutoCAD R9, is now labeled as "markup assist." The new feature is invoked by the LMB command, in the same manner as before. Before importing a new drawing, for example, use LMB to display the Markup Assistant dialog box. Choose File > Import, and select the desired drawing. In the Markup Assistant dialog box, which can be opened by clicking the Markup Assist button on the ribbon, you'll see the "markups" or "markup assist" tab. As before, you can opt to leave the markups on the imported file when you export it. A new Show Markup Assist Status icon appears in the status bar at the bottom of the screen, if you have Show Status on. When activated, it appears when you click the Markup Assist button on the ribbon. It will also appear in the LMB right-click menu for markups in the current drawing or an imported file. When activated, the icon displays in three states: Active (dark red): shows the Markup Assistant dialog box. Inactive (red): shows the standard Export Assistant dialog box. Off (gray): turns off the Markup Assistant dialog box. The Markup Assist dialog box contains a list of marker types that are available to you, along with a list of the classes that support the marker type. The Markup Assistant also displays a list of the functions and selections that are active or inactive for the imported file. This reflects any of your own changes to the imported drawing. When you display the Markup Assist dialog box, the uppermost marker types are listed on the Markups tab. If you click on one of the marker types, the functions that are active or inactive for that type will appear on the function tab. Markers and marker assists can be set as Global or Local. Global markers are active in all views, while local markers are active only in the current drawing. Global markers appear on the Markups tab, and local markers appear in the function or selection list. Both the local markers and global markers can be displayed in the status bar. Create markers for global uses
