Numeracy in nursing: a review of recent research. This article provides an overview of recent studies that have investigated numeracy in nursing. A scoping review of the literature was undertaken on 16 October 2011 in four databases, CINAHL, Medline, Medline in Process and PsycINFO. Data was extracted and analysed according to the qualitative research review guidelines. The majority of studies identified in this review were published in 2009-2011. The findings presented in the review fall under four main areas: nurses' perceived role, nurses' ability to understand and use basic numeracy skills, nurses' knowledge of their own numeracy skills, and their use of numeracy in nursing. A range of different approaches to the research was identified. Although the studies included in the review employed qualitative research methods, the majority of studies were quantitative or mixed-methods studies. One study revealed the development of a tool to measure the nursing students' numeracy skills, whereas another study reported a low level of numeracy skills among baccalaureate nursing students. The other studies all offered valuable information about the nurses' perceptions of their role, nurses' use of basic numeracy skills, and nurses' knowledge of their own numeracy skills. Study limitations, implications for future research, and recommendations for the nursing profession are discussed in this review.

Clinical efficacy of an oral iron supplement for preventing iron deficiency in a rural population. To determine the efficacy of an oral iron supplement (60-mg elemental iron, 2 or 3 times/day) in preventing iron-deficiency anemia in a female population. Double-blind, randomized, controlled clinical trial. Clinics in Georgia. Rural women with complaints of iron deficiency (n = 304). Subjects were randomly assigned to take 1 of 3 oral iron supplements (iron dextran, hematin, or iron-citrate); all supplements contained the same iron content (60 mg/capsule). After a washout period of 3 months, subjects were rerandomized to take one of the 3 iron supplements. Prevalence of iron deficiency, iron deficiency anemia, iron-deficiency anemia, and mean corpuscular volume (MCV). Unadjusted analysis showed no difference in the prevalence of iron-deficiency anemia between the iron-dextran and hematin groups (12% vs 12%; odds ratio [OR], 1.10; 95% confidence interval [CI], 0.58-2.10) or between the iron-dextran and iron-cit

Suppression of clinical relapses in multiple sclerosis by interferon beta-1a. In a recent multinational, randomized, placebo-controlled trial with 1-year follow-up, interferon beta-1a (IFN-beta-1a, Avonex) significantly reduced annualized relapse rates and clinical disability progression (compared with placebo) in patients with relapsing remitting multiple sclerosis (RRMS). We report interim analysis showing the initial effect of IFN-beta-1a on clinical and magnetic resonance imaging (MRI) findings during the year following discontinuation of treatment in the European part of this trial. Seventy-four percent of patients randomized to IFN-beta-1a had a treatment-induced relapse in comparison to 51% of those treated with placebo, whereas MRI studies did not show any significant effect of IFN-beta-1a on enhancing lesions or gadolinium-enhanced lesions.

The present invention relates to a video signal processing device and, more particularly, to a device for processing a video signal transmitted via a multichannel transmission line. When a video signal is transmitted via a multichannel transmission line, it is possible to carry out either a parallel transmission scheme or a serial transmission scheme. The parallel transmission scheme has a problem that it requires an extremely complicated circuit arrangement. In this type of transmission system, the video signal is multiplexed into a signal comprising a plurality of information bits and the resultant multiplexed signal is transmitted. On the other hand, the serial transmission scheme requires no particularly complicated circuit arrangement and does not require the simultaneous transmission of a plurality of video signals. However, the line utilization factor is low and the transmission rate is low. For these reasons, the parallel transmission scheme is mainly employed in satellite communication transmission systems and the serial transmission scheme is mainly employed in ground communication transmission systems. In addition, the parallel transmission scheme is also employed in high density information transmission systems (HDI (High Density Optical) and VIT (Video Interchange) for instance) for preparing video image signals for four or eight channels. In the prior art, as described in the Japanese Publication for Laying-open No. 59-110,510/1984, for instance, a video signal is divided into a plurality of blocks and the picture frequency components of each block are transmitted in parallel. The system of this prior art, however, has a drawback that the total band of the transmission channel is narrow. To increase the band
