A fantasy action role-playing game where players rise as a member of the Tarnished Class and duke it out with other Tarnished Lords in an RPG-style battle system. HOW TO FIND THE GAME ON THE WEB: * On the homepage, click the "Play Now!" button. * Then, click "Add a Game" to add "The Legend of Tarnished." The progress of color laser printers and inkjet printers for personal computers and word processors has significantly increased. The rapid increase in speed and capability of these printers has led to a demand for higher quality of print, faster print times and the ability to easily obtain the printout from the printer. The known sheet-through inkjet printer systems use rollers to feed paper from a supply roll into the printer. The rollers initially feed the sheet from the supply roll into the printer, then the printhead drops ink onto the sheet, and the final step is the sheet is fed through a series of rollers, including one or more perforated roller, to form a completed set. In one known printer (Applied Material Corp. Model 101-1), the printhead, the supply roll and the perforated roller are oriented such that the head

drops ink on the sheet after it is already a few inches from the supply roll. Perforated rollers allow the printed sheet to pass through, but tend to tear as the sheets pass through. This tearing produces an undesirable "ragged edge" on the printouts. In another known system (PhotoWorks Inc. Model N-80). The perforated rollers force the sheet through the printer without tearing it. The optical sensor directs the sheet onto a conveyor belt which then takes the sheet to the next set of rollers, including a "flattener" roller that flattens the paper into the final set. In this type of printer, the perforated rollers include a wider diameter on the last roller in the series of rollers to remove air bubbles from the sheet. The sheet is pressed against a solid surface, which can, at times, cause snagging of the sheet. In yet another known system (Brother Industries U.S.A. Model K4600), the perforated rollers force the sheet through the printer without tearing it. The optical sensor directs the sheet onto a conveyor belt which then takes the sheet to the next set of rollers, including a "flattener
