For more information about Photoshop, visit our tutorial page. Features of Photoshop Layer-Based Editing System Photoshop layers offer greater control over adjustments and allows users to paint on, erase, and move elements of an image to its greatest potential. The various layers in a document can be moved, resized, and textured to the point that they can be part of the image or an effect that the image is painted on, depending on the task at hand. The layers of the document can be enabled or disabled, and as layers are added and moved they are added to the active document or to a new document. Resize Layer Layers can be resized and moved within the bounds of a document, and they can be scaled. Layers can be moved into other documents or adjusted in size with the use of the scale tool. Adjustable Resolution The resolution of an image depends on the pixel size of the device used to view the image. The pixel size of a monitor is different from a device with a high pixel count, such as a scanner or a web camera. Photoshop's resolution tools allow you to adjust the pixel size of the image to match the specific device. Printer Support Photoshop comes with a built-in printer driver that can add support for default printer drivers or a user-made printer driver. These printer drivers allow you to send a document to the correct printer without hassle. Effects There are effects that you can add to an image that are meant to simulate the look of a specific picture. For example, there are graphic effects that simulate the look of paint splatters. The tools that you need for an effect are listed on the "Effects" menu in the toolbox, as are the options that are available for each effect. Effects Blur A sharp focus can be blurred using the blur tool. The blur tool is present in every toolbox. It is accessed through the toolbox menu by pressing Ctrl+T. This tool allows you to blur parts of an image while keeping other parts sharp. Sharpen This tool works the opposite way of the blur tool. It sharpens parts of an image that are already blurred. The sharpen tool is present in every toolbox. It is accessed through the toolbox menu by pressing Ctrl+SHIFT+T. This

Adobe Photoshop CC is the professional version of Photoshop. Photoshop CC does not contain any of the features that Photoshop Elements does, such as layers, masks, adjustment layers, colour panel, history panel, and the nondestructive selection tools. Your computer's program for handling images is called a graphics program. Photos are treated as graphics, meaning they consist of shapes, lines and colors. Photo tools provide tools for improving graphics. The most important ones are: image enlarging - the image is displayed large enough for detailed viewing, separating parts of the photo using adjustment layers, using adjustment layers to improve appearance of your photo, editing with brushes, filters, gradients and special effects, making graphics such as logos, photos, cartoons and brushes to use in your next artwork, making web graphics. Adobe Photoshop Lightroom is the desktop application used by professional photographers to organize, edit, and share photos. photography image enhancing Adjustment layers: Fix problems like white spots, colors, and contrast with various tools, including the Curves tool, Exposure tool, and levels. Adjustment layers: One of the most powerful tools in Photoshop, Adjustment Layers let you edit your image by adding, subtracting, and blending colors and tones, and applying filters and tonal adjustments. Adjustment layers: Layers are the bedrock of Photoshop, and Adjustment Layers extend that power. You can build a layer stacked on top of another, manipulate each of them individually, and combine them into powerful effects. Blend modes: These special blend modes let you combine multiple images, transitions, and colors in a single selection, and then apply any of several effects such as blending (blending colors from different photos), rescaling, and more. In an NFL season that has been largely underwhelming, one team has stood out from the crowd. The NFL on NBC analyst was kind enough to join the show to discuss the Atlanta Falcons' roller coaster season. In his weekly analysis of the state of the league, Tony Romo took a slightly different route than normal, as he dropped his usual scale from "bad" all the way to "terrible" and opened up with the surprisingly (to me) undefeated Atlanta Falcons. Romo opened up the show by breaking down why Atlanta has been so dominant. "Their body of work and the thing that's I think that's the most extraordinary about this team, is when you look at some of the teams that were winning playoff games, they were winning five playoff games in a row and five of the last six years. "People were saying, 'Oh, how much of a team can they be?' Because they're not some passing team, they're not some run-and-shoot team. They're an incredibly physical team. They are a finesse team, and they're not on the big part of the field and they're not going to get lots of yardage. "But they're doing it through the air a great deal of times, with everybody on the field for them. They're a team that maybe was going to be the underdog in this division and they're the No. 1 seed, so they get home-field advantage." And, according to Romo, Atlanta has some attributes that make them stand out. "The competitive nature that they have. They are not a team that's going to ride that deep tub to keep the focus. They are a team that's going to go for broke and they're going to get to the point where they have to win. They have done that a number of times this year. "When they've lost games, they come and play the final quarter. They've done that a lot. They are not the kind of team that won't go at you. They will go at you and use every shot they can. They don't want to run the ball. They want to throw it, run the pitch and catch. They'

Q: How do I make gulp serve my Webpack outputted JavaScript file? I can use the command gulp serve from my terminal, and all the JavaScript in my src folder shows up without reloading. But I cannot get it working from within a gulp/browserify workflow. I've tried the following with no luck (just fails silently): Using.pipe(browserify()) Using.pipe(browserify({require:'source-map'})) Using browserify-shim No errors are thrown, just no JavaScript is served. Should I have to include/require the source map somehow, or do something differently with the gulp serve command? A: You can't serve your browserified files using gulp serve because it is not a build tool. It only compiles and minifies files. This is why the gulp serve plugin was created. You can serve the compiled output of your build by running gulp serve. If you want to serve your source map files you need to run them through the source-map module as seen here: This is how it would look in your gulpfile.js: var sourceMap = require('gulp-source-map'); var map = new sourceMap.SourceMapGenerator({file: 'bundle.js'}); gulp.task('serve', function() { gulp.src('index.html').pipe(sourceMap.write()).pipe(gulp.dest('dist')); }); gulp.task('serve-source-map', function() { gulp.src('index.html').pipe(sourceMap.write('source-map')).pipe(gulp.dest('dist')); }); Then you can run them separately using: gulp serve # serves index.html and bundle.js gulp serve-source-map # serves index.html and source-map/bundle.js
