Polarized Meningioma of the Skull Base - Rarely Associated with Cerebral Edema and Lobulation - Case Report of a Rare Central Nervous System Lesion. Polarized meningioma is a tumor characterized by meningothelial cells with variable eosinophilic cytoplasm and elongated spindle or stellate cell shapes arranged in a radially polarized fashion, and it was first described in 1985. This tumor can be found at almost any location in the central nervous system and is usually asymptomatic. It is a rare tumor, with few cases having been reported in the literature. A 68-year-old female patient with chronic headaches and gait disturbance was diagnosed with a central mass at the skull base. Imaging study identified a unilateral, expansive, solid mass in the right frontal lobe and adjacent dura, and the patient underwent surgical resection. On histological examination, the tumor showed a pattern of meningothelial cells arranged radially with peripheral palisading and rosette patterns, consistent with a polarized meningioma. The differential diagnosis is mainly limited to neoplastic and nonneoplastic processes involving the meninges. Knowledge of the various features of this entity is key to making an accurate diagnosis. Before the 2012 election, Tony Abbott promised the Gillard government that he would not allow such a special deal to be made. He said during the campaign that the special exemption was a “ticking time bomb.” However, the Abbott government, ever keen to give the impression that it is a different kind of government to what they inherited, has since indicated they are prepared to rubberstamp the deal as long as Labor does. In a long-awaited policy statement released to Fairfax Media on Thursday, Attorney-General Nicola Roxon pointed out that changes to the special deal were recommended by a review of industrial relations in Australia in 2011 but had not yet
