Craniek Czeszyn Visual Studio or (VS.NET) Â· Dimitar Parlic VisioForge SDKs.NET Bundle Premium 11.0.58 Retail.The present invention relates to an image display system for displaying images on a display device based on input image data and, more particularly, to an image display system for displaying an image from an image file on a display device. Image display systems of this type are used, for example, to display images on monitors. They are commercially available in the form of integrated systems and may be used as stand-alone systems. The image data to be displayed are supplied by a

computer or data processing unit and image data are sent to the monitor from a number of memory devices, such as hard disk drives, CD-ROM drives, or so forth. The image data can be supplied over a data bus. The data bus may, for example, be connected to a standard PCMCIA type interface such as the type of interface generally designated by the trade mark PCMCIA. Image data may be supplied to an image display system over a local area network. In that case, the image data are supplied in the form of packets. A standard PCMCIA interface has, however, only a limited data rate. A method of transferring image data which has been designed especially for use with an image display system of the type mentioned in the preamble is described in DE 39 18 591 A1. In that document, it is also proposed that the image data be supplied in the form of so-called "simple image frames". A simple image frame is created from image data and comprises a plurality of image elements arranged on a common row. A row is supplied for each frame and the elements are arranged in the row in the known manner. By linking together all the rows of image data, an image frame is created. The image frame is stored in a memory and is displayed on a display device. Many applications of image display systems are, however, limited in terms of the amount of data which can be processed. For example, many image display systems are limited to a data transfer rate of no more than 2 Mbit/sec. It is an object of the present invention to provide an image display system which has a data transfer rate which is increased in comparison with the data transfer rate for image data supplied by a standard PCMCIA interface.
