The present invention relates to a device for monitoring the strength of a road by means of an articulated vehicle which is capable of moving on a roadway, in particular of moving on pavements. It is known in the automotive industry for heavy articulated vehicles which are capable of moving on roads to be equipped with in-house strength monitoring systems for determining whether the vehicle is being used with or without the appropriate driver operating controls. Such monitoring systems are often referred to as "safety systems" and are used in order, for example, to monitor in an undesired manner that a driving wheel of the vehicle is in an excessive slip state, so that this causes loss of driving control of the vehicle, the latter possibly resulting in a crash. DE 102 39 426 A1 discloses a monitoring system for an articulated vehicle, wherein, in the normal case, the vehicle moves on a roadway, and the vehicle is capable of being driven in either a conventional normal driving mode or in a safe driving mode. A first measuring device is provided for measuring and monitoring the driving speed of the vehicle in both the normal driving mode and in the safe driving mode. A second measuring device is provided for detecting the actual driving speed of the vehicle in both the normal driving mode and in the safe driving mode. A drive motor is provided for driving the vehicle in the normal driving mode. A motor-torque regulating device is provided for regulating the output torque of the drive motor. A comparison device compares the actual driving speed of the vehicle in the normal driving mode with the predetermined normal driving speed stored in a control device. A switching means switches the motor-torque regulating device between a drive mode and a safety mode in response to the signals output by the comparison device. An object of the present invention is to provide a device for monitoring the strength of a road by means of an articulated vehicle which is capable of moving on a roadway, in particular of moving on pavements, which can be adapted simply and quickly to different driving conditions of the articulated vehicle and which gives reliable and dependable information concerning the driving mode of the vehicle. This and other objects and advantages are achieved by the device according to the invention, in which c6a93da74d
